1.1.35 Trupi i hedhur me shpejtësi fillestare $v_0 = 40 \text{ m/s}$, që me horizontin përfshin këndin φ arrinë lartësinë më të madhe $y = 20,4 \text{ m}$. Të gjendet largësia maksimale e trupit nëse rezistenca e ajrit nuk përfillet.

Zgjidhje:

Të dhënat:

$$v_0 = 40 \frac{\text{m}}{\text{s}}$$

$$\varphi = ?$$

$$y_{\text{max}} = 20,4 \text{ m}$$

$$x_{\text{max}} = ?$$

$$g = 9,81 \frac{\text{m}}{\text{s}^2}$$

$$x_{\text{max}} = \frac{v_0^2 \sin 2\varphi}{g}$$

$$y_{\text{max}} = \frac{v_0^2 \sin^2 \varphi}{2g}$$

$$2g y_{\text{max}} = v_0^2 \sin^2 \varphi$$

$$\sin^2 \varphi = \frac{2g y_{\text{max}}}{v_0^2}$$

$$\sin \varphi = \sqrt{\frac{2g y_{\text{max}}}{v_0^2}} \rightarrow \varphi = \arcsin \sqrt{\frac{2g y_{\text{max}}}{v_0^2}}$$

$$\varphi = \arcsin \sqrt{\frac{2 \cdot 9,81 \frac{\text{m}}{\text{s}^2} \cdot 20,4}{(40 \frac{\text{m}}{\text{s}})^2}}$$

$$\varphi = \arcsin \frac{1}{2}$$

$$\varphi = \arcsin \sqrt{\frac{400248 \frac{\text{m}^2}{\text{s}^2}}{1600 \frac{\text{m}^2}{\text{s}^2}}} = \arcsin \sqrt{0,25}$$

$$\varphi = \arcsin 0,5 = 30^\circ$$

$$\varphi = 30^\circ$$

$$v_0 = 40 \frac{\text{m}}{\text{s}}$$

$$x_{\text{max}} = \frac{v_0^2 \sin 2\varphi}{g} = \frac{1600 \frac{\text{m}^2}{\text{s}^2} \cdot \sin 60^\circ}{9,81 \frac{\text{m}}{\text{s}^2}}$$

$$x_{\text{max}} = \frac{1600 \frac{\text{m}^2}{\text{s}^2} \cdot 0,866}{9,81 \frac{\text{m}}{\text{s}^2}} = \frac{1385,64 \text{ m}}{9,81}$$

$$x_{\text{max}} = 141,2 \text{ m}$$
