1.2.98 Të përcaktohet nxitimi i rëndimit tokësor g në lartësinë $h=20$ km mbi Tokë, kur dihet nxitimi standard $g^0=9.80665 \text{ m/s}^2$ (në sipërfaqën e Tokës në nivelin e detit) si dhe rrezja e Tokës $R=6.38 \cdot 10^3 \text{ m}$.
 Zgjidhja $R=6.38 \cdot 10^6 \text{ m}$

Të dhënat:

$$g=?$$

$$h=20 \text{ km} = 20 \cdot 10^3 \text{ m}$$

$$g^0 = 9.80665 \frac{\text{m}}{\text{s}^2}$$

$$\underline{R_T = 6.38 \cdot 10^6 \text{ m}}$$

$$mg^0 = \mu \frac{M_T}{R_T^2} \rightarrow g^0 = \mu \frac{M_T}{R_T^2}$$

$$mg = \mu \frac{M_T}{(R_T+h)^2} \rightarrow g = \mu \frac{M_T}{(R_T+h)^2}$$

$$\frac{g}{g^0} = \frac{\cancel{\mu} \frac{M_T}{(R_T+h)^2}}{\cancel{\mu} \frac{M_T}{R_T^2}} = \frac{R_T^2}{(R_T+h)^2} \cdot g^0$$

$$g = g^0 \frac{R_T^2}{(R_T+h)^2}$$

$$g = 9.80665 \frac{\text{m}}{\text{s}^2} \cdot \frac{(6.38 \cdot 10^6 \text{ m})^2}{(6380 \cdot 10^3 + 20 \cdot 10^3)^2 \cdot \text{m}^2}$$

$$g = 9.80665 \frac{\text{m}}{\text{s}^2} \cdot \frac{40.70 \cdot 10^{12} \cancel{\text{m}^2}}{(6400 \cdot 10^3)^2 \cancel{\text{m}^2}}$$

$$g = \frac{398.90 \cdot 10^{12} \frac{\text{m}}{\text{s}^2}}{40.96 \cdot 10^{12}} = \underline{9.738 \frac{\text{m}}{\text{s}^2}}$$

$$\boxed{g = 9.738 \frac{\text{m}}{\text{s}^2}} \quad \checkmark$$
